Hi I'm Amna Qayyum, a UI/UX Designer & Developer.

I design and build clear, usable interfaces for complex systems and real user workflows, from requirements and user flows to wireframes, prototypes, and production-ready UI.

With 5+ years of front-end development experience, I create interfaces that are consistent, accessible, and practical to build.

Skills

UI/UX Design: User flows, wireframing, prototyping, UI & visual design, design systems, accessibility

Design Tools: Figma, Adobe XD, Photoshop, Illustrator

Front-End: HTML, CSS/SCSS, Tailwind, Bootstrap, JavaScript, TypeScript, Angular, React, GSAP

Education

BS Software Engineering, Bahria University, Islamabad · 2016 – 2020

CareCloud

EHR Interface Modernization · UI Design & Development

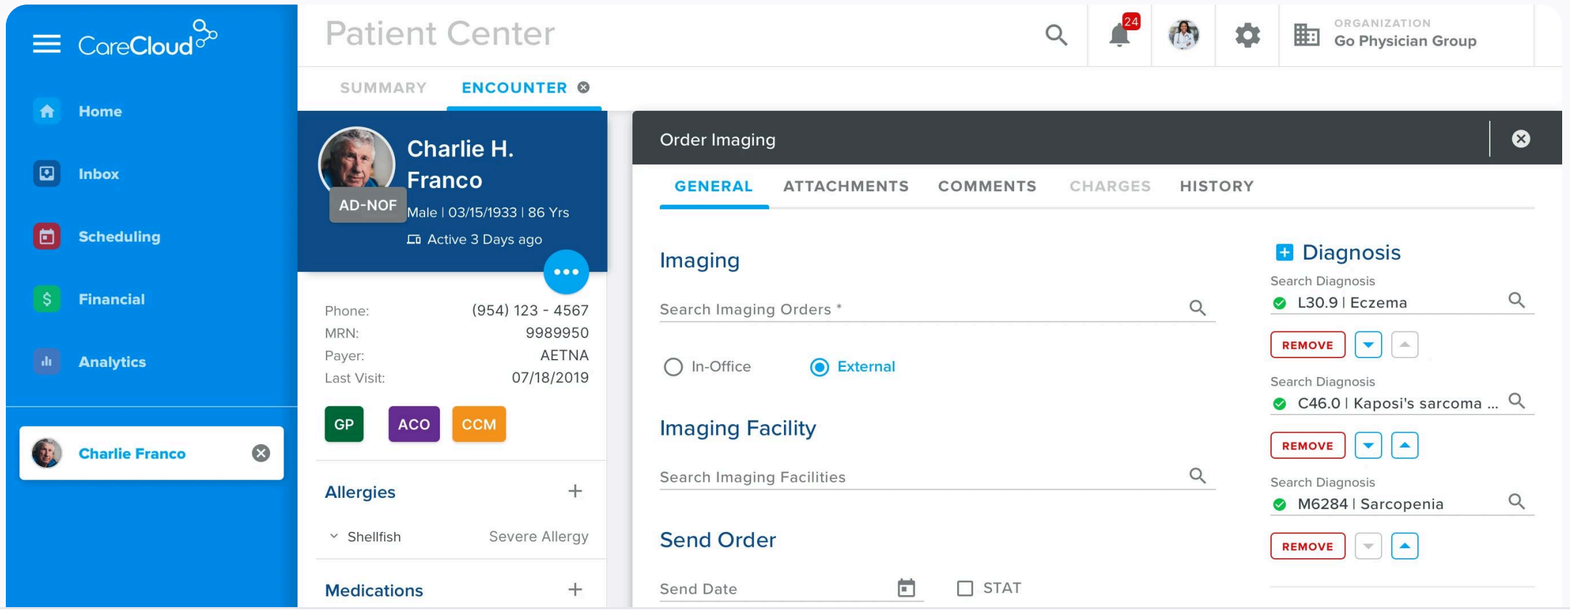

CareCloud is a cloud-based healthcare platform used by providers for EHR, practice management, and patient engagement. As a UI designer and developer, I helped move the platform from a legacy interface to a modern Angular Material design, creating UI style guides and reusable components used across clinical and administrative modules.

PROBLEM STATEMENT

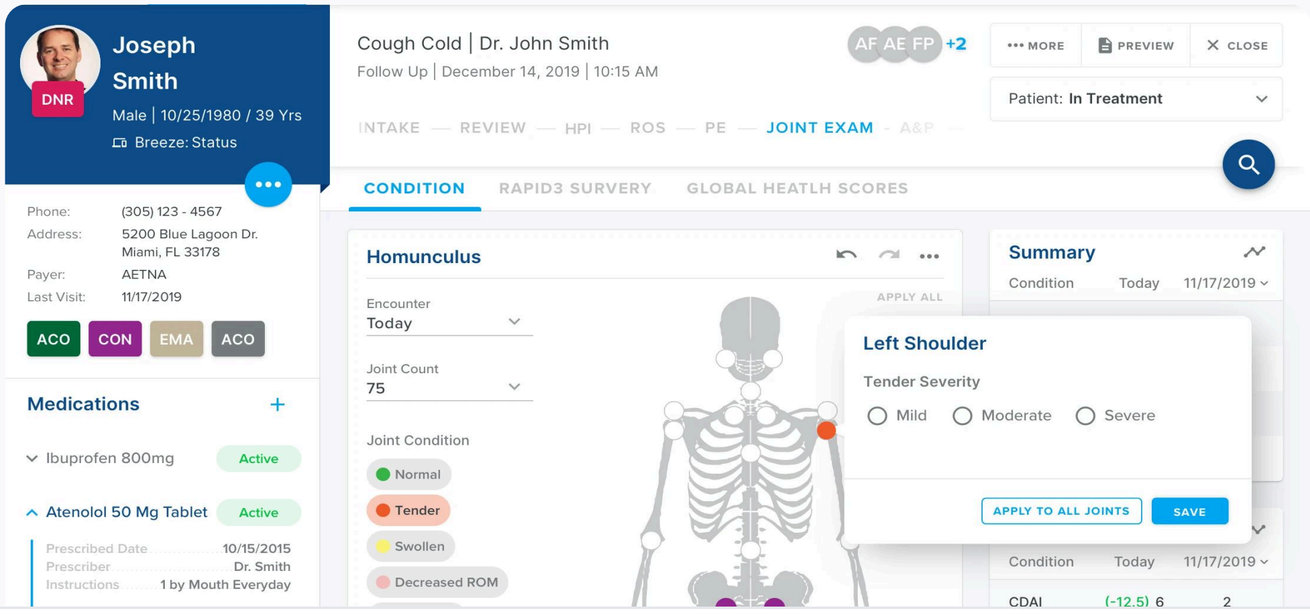

The legacy UI had inconsistent layouts, spacing, and component behavior in high-use screens like patient summaries and schedules. For clinicians processing dense information quickly, these inconsistencies added cognitive load, slowed workflows, and created potential for error in a high-stakes environment.

DESIGN APPROACH

Working with the UI team and product stakeholders, I focused on making high-use screens consistent and easy to scan. I defined shared rules for layout, spacing, typography, and interactive states in a UI style guide, then built them into modular, accessible Angular components and reusable data displays. This standardized how clinical data is presented, making dense information easier to read and act on, while keeping all existing backend functionality intact.

Patient Center – Encounter Management

Patient profile, medications, and documenting clinical assessments

ALMARWAN

A bilingual corporate website, designed and built end to end for a UAE real estate developer.

Al Marwan Developments needed a modern public platform for its portfolio, news, and contact. I handled the full redesign and frontend redevelopment, from understanding requirements and planning the site structure to high-fidelity UI design and a responsive, bilingual (English/Arabic) build.

DESIGN & BUILD APPROACH

I designed a clean, structured interface with consistent spacing, typography, and reusable components to keep content easy to scan and simple to maintain. Layouts were planned mobile-first and mirrored for right-to-left reading, so the design intent holds in both English and Arabic. I then built it as a fully responsive frontend in HTML, CSS, and JavaScript, with semantic markup, dark and light themes, RTL support, and a focus on performance.

CNTRLID

A streamlined link management platform for creators, agencies, and small businesses · UI/UX Design

Many link-in-bio tools overwhelm users with excessive customization and complex interfaces, making simple tasks like adding or reordering links slow and frustrating. I designed around the core tasks (claiming a link, building a profile, and tracking analytics), keeping customization to essentials, with a clear visual hierarchy and predictable, consistent interactions that make the interface intuitive and efficient.
